GenomOncology

GENOMANALYTICS

Visualize and analyze molecular and clinical patient data in one, comprehensive view.

Features

Integrated Data
Visualize and analyze comprehensive summaries of all integrated clinical and molecular data in one or more dashboards.

Survival Analysis
Review survival data of an individual's case, or of an aggregated set of data for larger cohorts, through Kaplan-Meier graphs.

Recommendation Investigation
Identify top clinical trials matched for your patient population, including top triggering biomarkers and institution-specific or geo-located trials.

Operational Dashboards
Gain insights into laboratory operational metrics, such as turnaround time, number of cases per month, and sign-out numbers per user.

Cohort Identification
Review cohorts of patients that can be identified for enhancing clinical trial enrollment or matching to a new approved therapy.

Configurable Dashboards
Create customizable dashboards with user-specific graphs or modals that will automatically update based on available data.

Sophisticated Analysis
Utilize the tool's easy-to-use user interface to configure dashboards for simplified review and analysis.

Benefits

- Our flexible tool enables a comprehensive review of patient clinical and molecular data through customized dashboards and filtering.

- Perform survival analysis on different case cohorts to determine survival differences between each group.

- Determine recurring, co-occurring, and mutually exclusive alterations across cohorts and different disease types using embedded features.

- GenomAnalytics can integrate with Jupyter notebooks and R data tools.
